(57) Abstract :

The present disclosure proposes a peer-to-peer communication system (100) for infrastructure-independent emergency communication across distributed nodes. The peer-to-peer communication system (100) comprises plurality of computing devices (102), a communication interface (128), plurality of functional modules (108), and a dashboard interface module (126). The peer-to-peer communication system (100) provides an infrastructure-independent emergency communication framework configured for decentralized message dissemination across dynamically changing network nodes operating without dependence on centralized servers, cellular infrastructure, internet connectivity, or fixed communication routers. The peer-to-peer communication system (100) is a resilient zero-infrastructure peer-to-peer communication framework configured to enable decentralized emergency communication between distributed computing devices (102) without dependence on centralized servers, internet connectivity, cellular infrastructure, fixed wireless routers, or preconfigured communication infrastructure.
